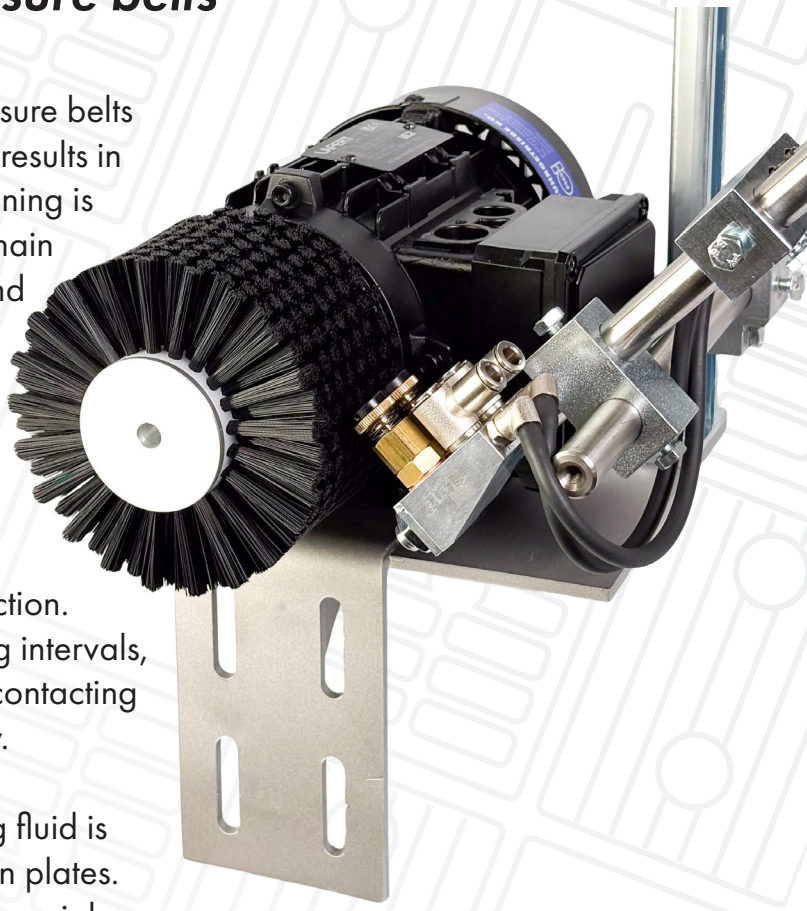
Belt Chain Cleaner

»Automatic Cleaning«

of chain plates and top pressure belts



Manual cleaning of chain plates and top pressure belts by hand is a time-consuming task that usually results in machine downtime. Nonetheless, regular cleaning is essential and highly recommended, as dirty chain plates and pressure belts often leave marks and residues on the workpieces.

» The automatic belt and chain cleaner guarantees consistent cleanliness «

The system can be switched on during normal machine operation without interrupting production. A dedicated control unit regulates the cleaning intervals, ensuring that every section of the workpiece-contacting components is cleaned evenly and thoroughly.

First, the specially developed **BCF25** cleaning fluid is applied to effectively loosen dirt from the chain plates. Then, the surfaces are thoroughly cleaned by special brushes that rotate in the opposite direction of the machine's running direction.

Scope of delivery:

- **Special brushes tailored for either top pressure belts or chain plates, depending on application**
- **Motor mount including three-phase motor**
- **Spraying system set with control unit**
